LEGEND

- Elmbridge Borough Council Boundary
- Settlement
- Allocation Sites
- EA Main River
- Open Ordinary Watercourses
- Culverted Ordinary Watercourse
- Surrey County Council Highways Ditch
- Surface Water Bodies
- Reduction In Risk of Flooding from Rivers and Sea due to Defences

Flood Zones

- Flood Zone 3b
- Flood Zone 3a
- Flood Zone 2

NOTES

1: This map shows the predicted likelihood of fluvial flooding based on the Environment Agency's Flood Map for Planning (Rivers and the Sea) and catchment modelling studies, which may be subject to revision in the future. The Flood Map for Planning is provided on the Environment Agency website (https://flood-map-for-planning.service.gov.uk/).
2: The probability of fluvial flooding is divided into the following four categories: Flood Zone 1, Flood Zone 2, Flood Zone 3a and Flood Zone 3b. Refer to the SFRA Report for further detail of the Flood Zones and how modelling studies have been used to define the extents of Flood Zone 3b.
3: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

NOTES

1: This map shows the predicted likelihood of fluvial flooding during the defended 1% annual exceedence probability (AEP) events including climate change allowances and a 0.1% AEP for the Lower Thames: Thames Dominated model. Refer to the SFRA Report for further detail of the modelling study used to define the extents.
2: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

1: This map shows the predicted likelihood of fluvial flooding during the defended 1% annual exceedence probability (AEP) events including climate change allowances and 0.1% AEP for the Lower Thames: Tributary Dominated model. Refer to the SFRA Report for further detail of the modelling study used to define the extents.
2: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

NOTES

1: This map shows the predicted flood hazard for the Lower Thames: Tributary Dominated 2023 model during a 1% annual exceedence probability event (AEP) including a 35% allowance of climate change. Refer to the SFRA Report for further detail of the modelling study used to define the hazard.
2: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

NOTES

1: This map shows the predicted flood hazard for the Lower Thames: Tributary Dominated 2023 model during a 1% annual exceedence probability event (AEP) including an 81% allowance of climate change. Refer to the SFRA Report for further detail of the modelling study used to define the hazard.
2: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

NOTES

1: This map shows the predicted likelihood of fluvial flooding during the defended 1% annual exceedence probability (AEP) events including climate change allowances and 0.1% AEP for the Dead River, Lower Mole, Middle Mole, River Rythe and Lower Wey. Refer to the SFRA Report for further detail of the modelling studies used to define the extents.
2: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

- 0.1 to 0.5
- 0.5 to 1
- 1 to 2
- 2 to 3
- 3<

NOTES

1: This map shows the predicted flood depths for the Lower Mole 2009 model during a 1% annual axceedence probability event (AEP) including a 20% allowance of climate change. It should be noted that this extent has been clipped due to updated modelling available in the Dead River Area. Refer to the SFRA Report for further detail of the modelling study used to define the depth.
2: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

NOTES

1: This map shows the predicted flood hazard for the River Rythe 2016 model during a 1% annual exceedence probability event (AEP) including a 20% allowance of climate change. Refer to the SFRA Report for further detail of the modelling study used to define the hazard.
2: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

Risk of Flooding from Surface Water

- High
- Medium
- Low

NOTES

1: Surface water flooding occurs when rainwater does not drain away through the normal drainage systems or soak into the ground, but lies on or flows over the ground instead. This type of flooding can be difficult to predict as it is hard to forecast exactly where or how much rain will fall.
2: This map shows the predicted likelihood of surface water flooding based on the Environment Agency's Risk of Flooding from Surface Water (ROFSW) data, which may be subject to further analysis in the future. Further information is provided on the Environment Agency website (https://www.gov.uk/check-long-term-flood-risk).
3: Surface water risk is divided into four categories: High - Flooding greater than 3.33% Annual Exceedence Probability (AEP), Medium - Flooding between 3.33% and 1% AEP, Low - Flooding between 1% and 0.1% AEP and Very Low - Less than 0.1% AEP.
4: The potential impact of surface water flooding can vary according to the depth of the water and its velocity (speed and direction its flowing in).
5: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

Risk of Flooding from Surface Water

- High
- Medium
- Low

NOTES

1: Surface water flooding occurs when rainwater does not drain away through the normal drainage systems or soak into the ground, but lies on or flows over the ground instead. This type of flooding can be difficult to predict as it is hard to forecast exactly where or how much rain will fall.
2: This map shows the predicted likelihood of surface water flooding based on the Environment Agency's Risk of Flooding from Surface Water (ROFSW) data, which may be subject to further analysis in the future. Further information is provided on the Environment Agency website (https://www.gov.uk/check-long-term-flood-risk).
3: Surface water risk is divided into four categories: High - Flooding greater than 3.33% Annual Exceedence Probability (AEP), Medium - Flooding between 3.33% and 1% AEP, Low - Flooding between 1% and 0.1% AEP and Very Low - Less than 0.1% AEP.
4: The potential impact of surface water flooding can vary according to the depth of the water and its velocity (speed and direction its flowing in).
5: This map is intended to provide a strategic overview of fluvial flood risk and should not be used to assess the flood risk for individual properties.

Susceptibility to Groundwater Flooding

- Limited potential for groundwater flooding to occur
- Potential for groundwater flooding of property situated below ground level
- Potential for groundwater flooding to occur at surface

NOTES

1: The BGS Susceptibility to Groundwater Flooding dataset identifies areas where geological conditions could enable groundwater flooding to occur and where groundwater may come close to the surface.
2: The dataset is based on geological and hydrogeological information and is mapped to a 1:50,000 scale.
3: The geological interpretation should only be used as a guide to the geology at a local level, not as a site specific geological plan based on detailed site investigations.
4: Refer to the SFRA Report for further information on groundwater flooding.
6: This map is intended to provide a strategic overview of susceptibility to groundwater flooding and should not be used to assess flood risk for individual properties.
